

This little guide will help you make a new torrent and then upload it to TorrentLeech.

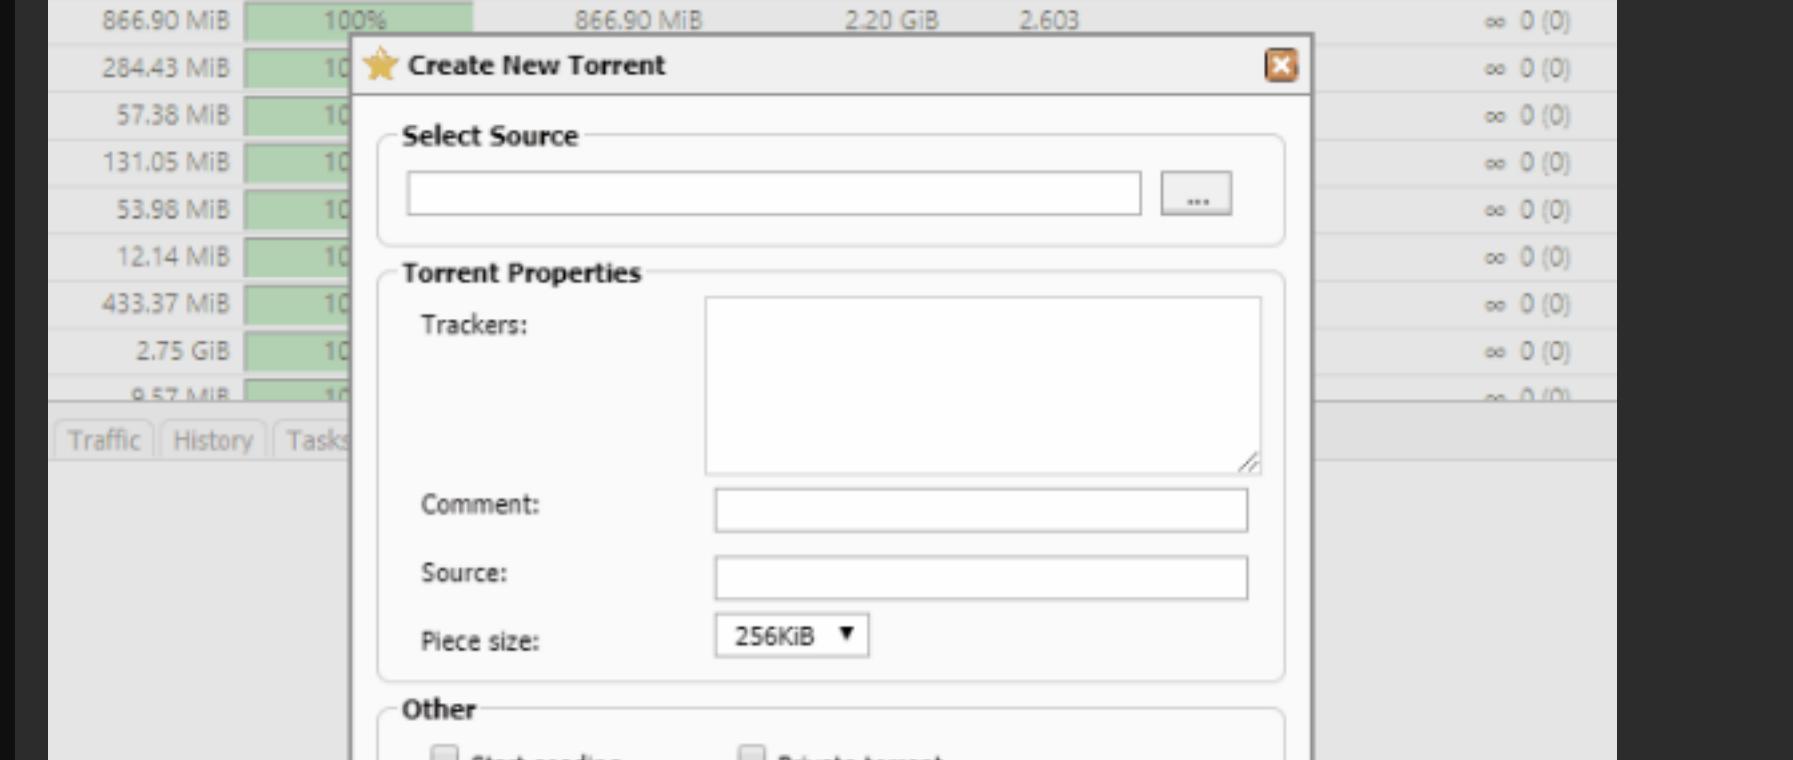

Step 1: Make a new torrent

Making a torrent is pretty simple. As there are loads of clients out there we can't cover them all. In this guide I will be using ruTorrent, which is a client usually found on seedboxes. The basics behind making torrents is the same for each client, just the buttons you have to click are different.

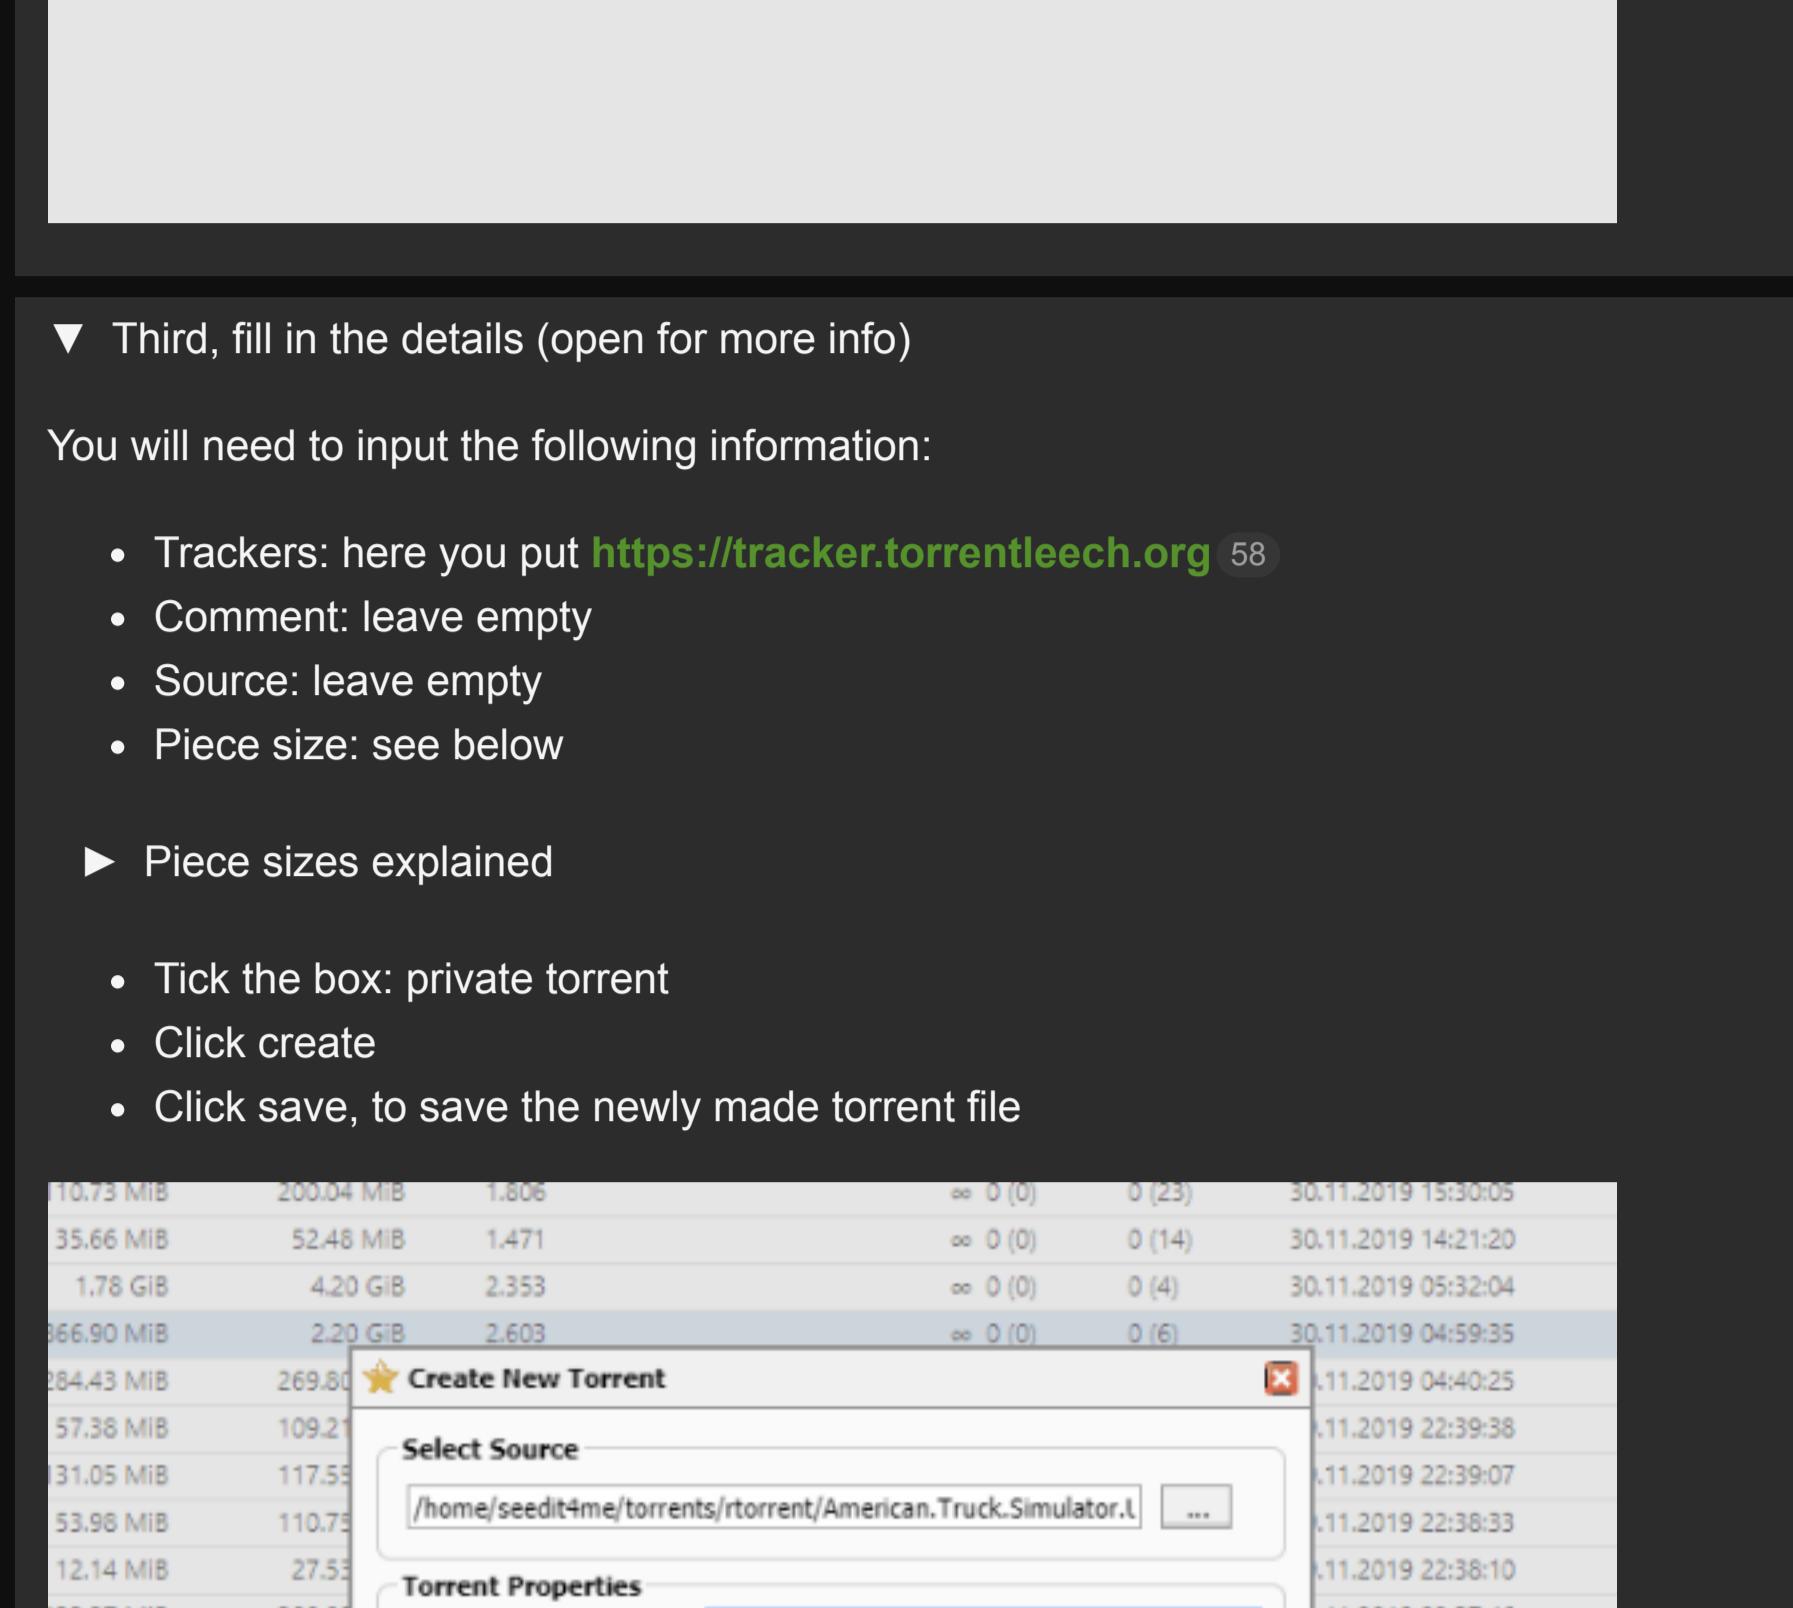

Depending on what you are uploading you will need to sort the files into one or more directories. If you are uploading a single, unRARed movie/tv file then you do not need to use folders.

In this example we will use a torrent with multiple RAR files in a single folder. Once you fire up ruTorrent you click the button to make a new torrent. When you create a torrent you will need to have the files on the same location as your client, so on a seedbox you will need to have the files uploaded to the box already. When you make a torrent from home you will need to have the files on your harddisk.

▼ First, click 'new torrent'

▼ Second, navigate into the folder you want to use

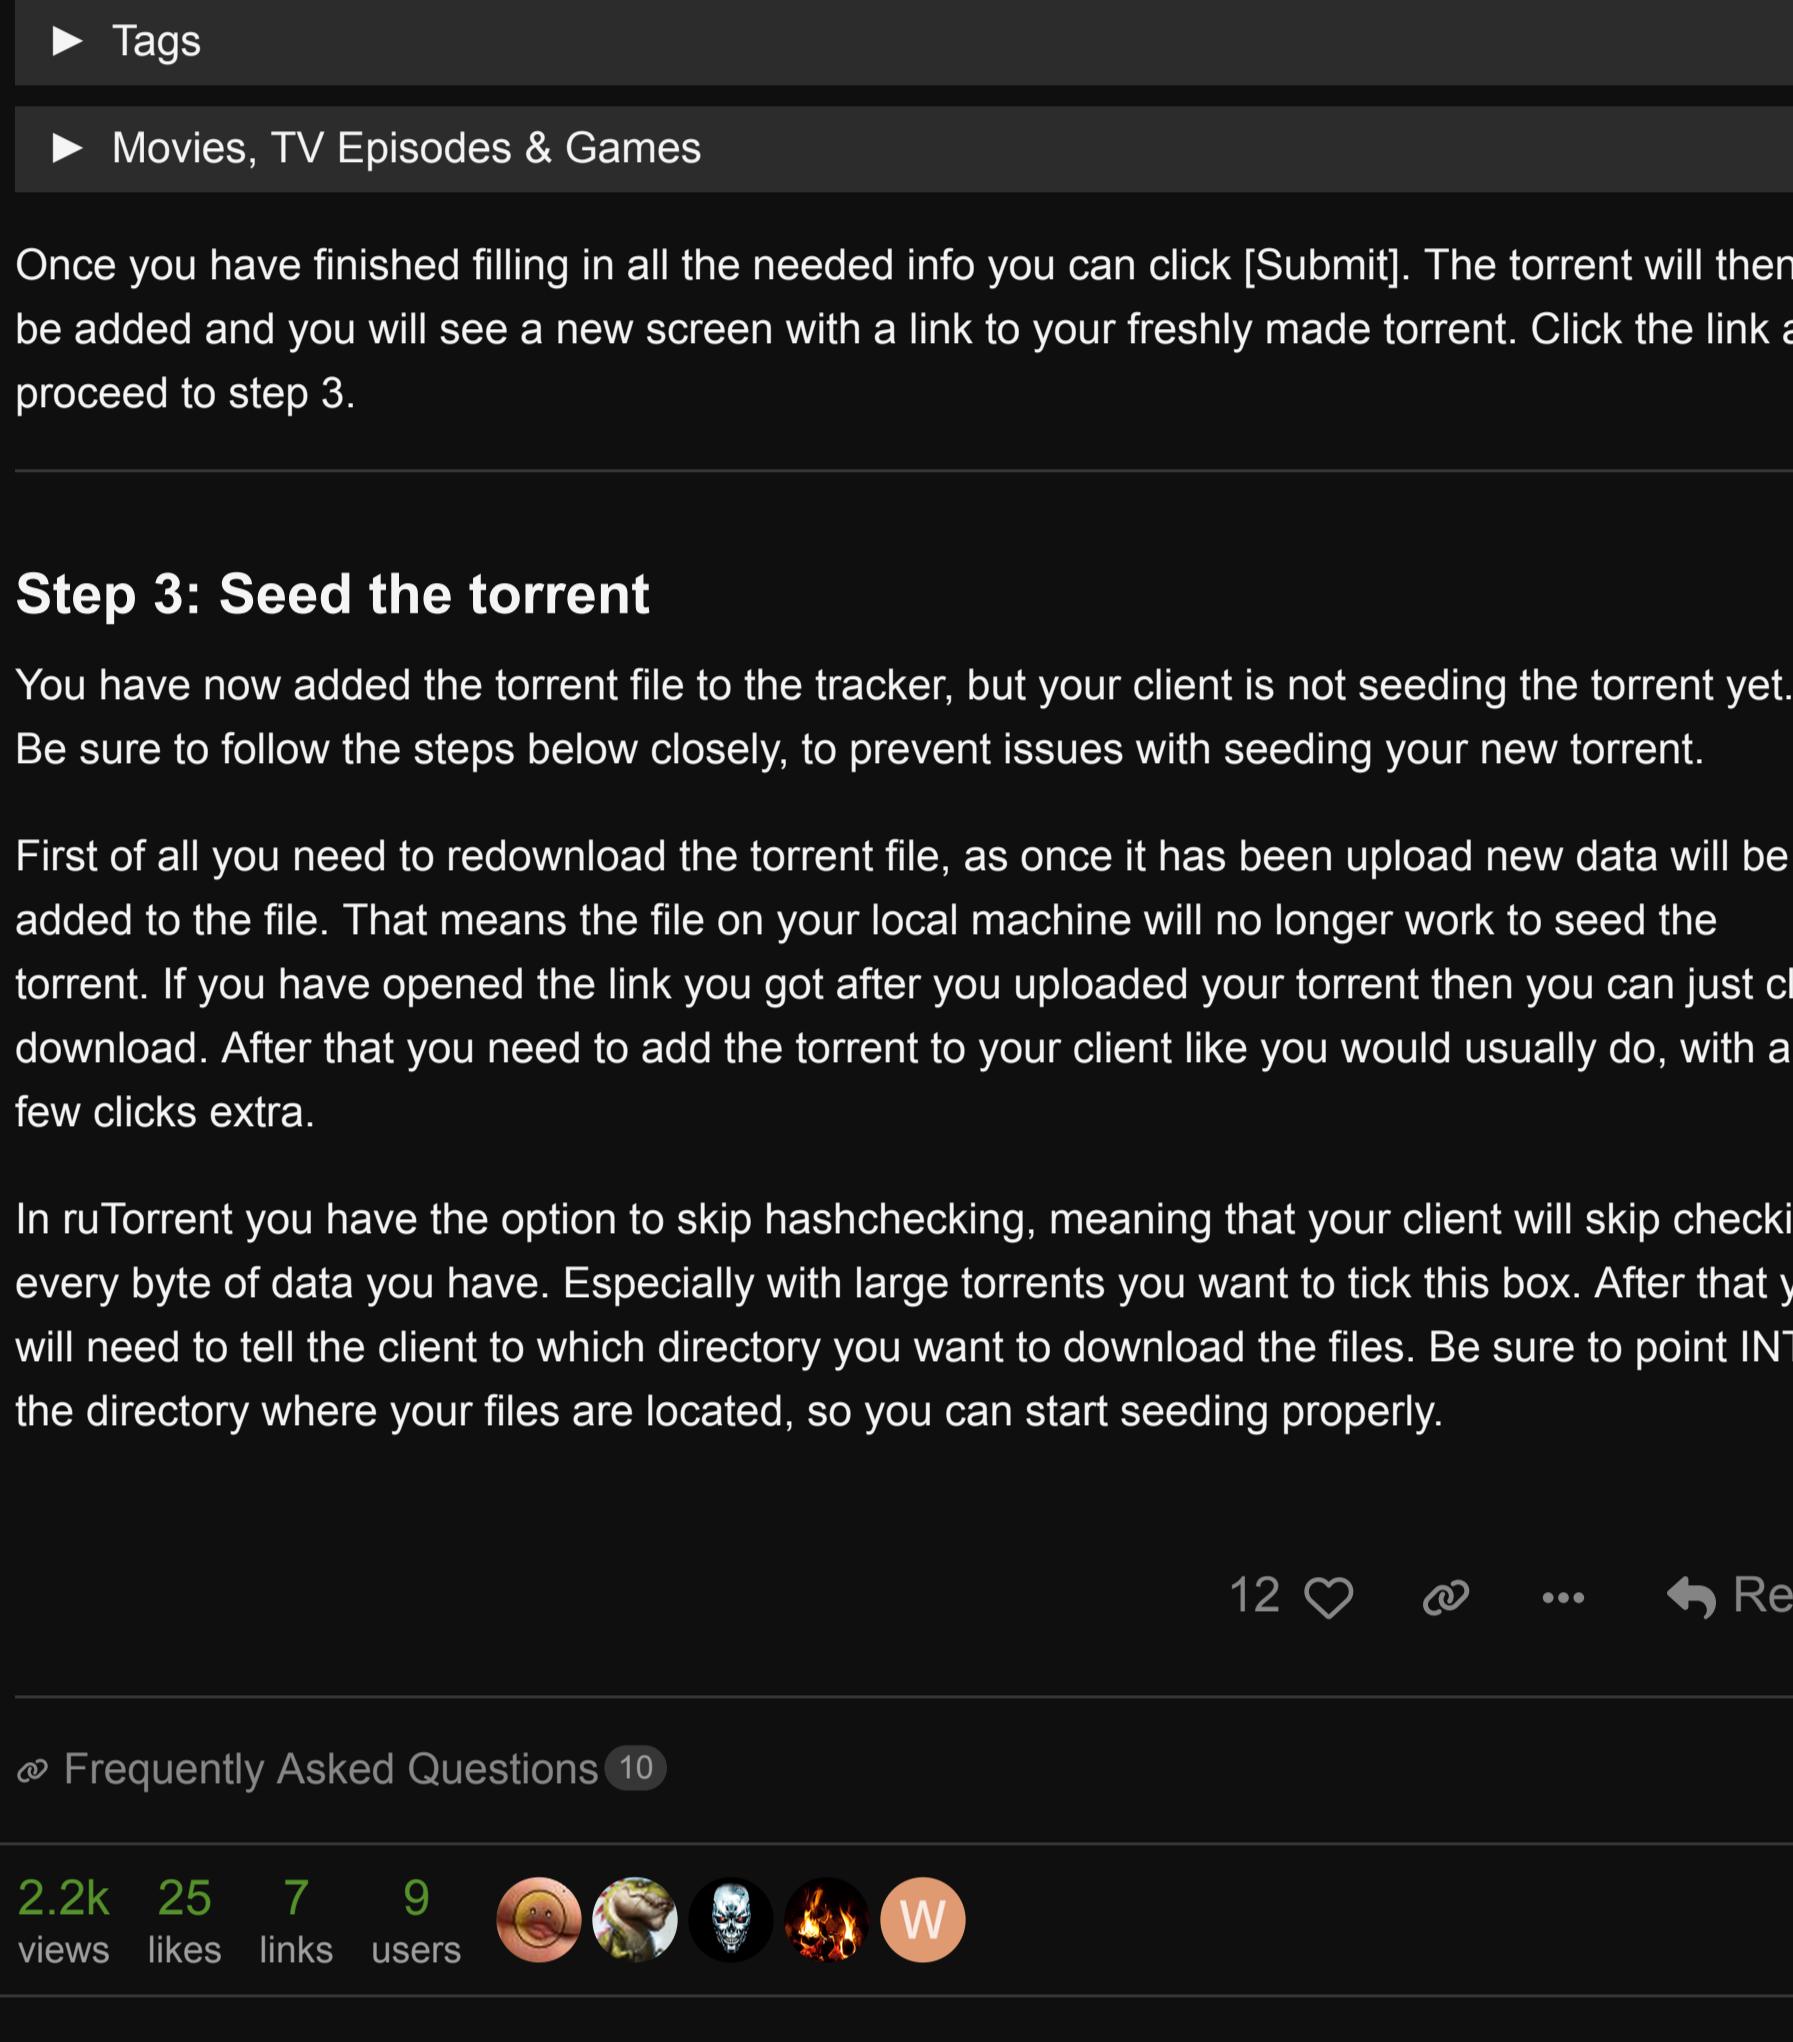

▼ Third, fill in the details (open for more info)

You will need to input the following information:

- Trackers: here you put <https://tracker.torrentleech.org>
- Comment: leave empty
- Source: leave empty
- Piece size: see below

► Piece sizes explained

- Tick the box: private torrent
- Click create
- Click save, to save the newly made torrent file

You can then select the folder by navigating through your seedbox. You can go up one level by double clicking the two dots, and select the directory you are currently in by double-clicking the single dot.

Step 2: Upload the torrent

Once you have created the torrent file it will be saved to your local machine, from where you can add it to the tracker. You can do so by opening the upload page, either by clicking on your name and then **upload** on the main site, or by clicking [here](#).

On the new page there are a few options you **must** fill, or your torrent will either not be uploaded or you will get a PM from yours truly. An overview of what you need to do:

► General options
► Images Options
► Tags
► Movies, TV Episodes & Games

Once you have finished filling in all the needed info you can click [Submit]. The torrent will then be added and you will see a new screen with a link to your freshly made torrent. Click the link and proceed to step 3.

Step 3: Seed the torrent

You have now added the torrent file to the tracker, but your client is not seeding the torrent yet. Be sure to follow the steps below closely, to prevent issues with seeding your new torrent.

First of all you need to redownload the torrent file, as once it has been upload new data will be added to the file. That means the file on your local machine will no longer work to seed the torrent. If you have opened the link you got after you uploaded your torrent then you can just click download. After that you need to add the torrent to your client like you would usually do, with a few clicks extra.

In ruTorrent you have the option to skip hashchecking, meaning that your client will skip checking every byte of data you have. Especially with large torrents you want to tick this box. After that you will need to tell the client to which directory you want to download the files. Be sure to point INTO the directory where your files are located, so you can start seeding properly.

Edited to add that, if you have used the announce url that is unique to you on the upload page, you do not have to redownload the torrent from the site 😊

And that is not possible in most clients, hence the simple version above.
